# Recursion

- We've already seen some examples
- A very natural approach when the data structure is recursive (e.g. lists, trees)
- But also example processing algorithms
- Next week we'll express **depth first graph traversal** recursively (the natural way); later we'll meet other examples of recursion too

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

recursive array

# Example: Factorial

- $n!$ : we can use recursion (left) or iteration (right)

## Assignment Project Exam Help

$$F(5) = F(4) \cdot 5$$

<https://eduassistpro.github.io/>

$$= (F(3) \cdot 4) \cdot 5$$

Add WeChat edu\_assist\_pro

n: 0

$$= ((F(2) \cdot 3) \cdot 4) \cdot 5$$

$$= (((F(1) \cdot 2) \cdot 3) \cdot 4) \cdot 5$$

result: 120

$$= (((((F(0) \cdot 1) \cdot 2) \cdot 3) \cdot 4) \cdot 5$$

$$= (((((1 \cdot 1) \cdot 2) \cdot 3) \cdot 4) \cdot 5$$

$$= 120$$

iterative version  
normally  
preferred since it is  
constant space

# Example: Fibonacci Numbers

THE UNIVERSITY OF  
MELBOURNE

- To generate the  $n$ th number of sequence: 1 1 2 3 5  
8 13 21 34 55 ...

Follows the mathematical  
definition of Fibonacci

Assignment Project Exam Help  
numbers very closely.

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro  
easy to understand

Basic operation: addition

But performs lots of  
redundant computation

Complexity is **exponential** in  $n$

# Fibonacci Again

- Of course we only need to remember the latest two items. Recursive version: left; iterative version: right

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

Initial call:  $\text{Fib}(n, 1, 0)$

Time complexity of both solutions is linear in  $n$

(There is a cleverer, still recursive, way which is  $O(\log n)$ .)

# Tracing Recursive Fibonacci

THE UNIVERSITY OF  
MELBOURNE

```
function FIB( $n, a, b$ )  
  if  $n = 0$  then  
    return  $a$   
  return FIB( $n - 1, a + b, a$ )
```

Assignment Project Exam Help

Initial call: Fi <https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

Fibonacci  
Sequence:  
1 1 2 3 5 8 ...

Fib(5,  
= Fib(4,1,1)  
= Fib(3,2,1)  
= Fib(2,3,2)  
= Fib(1,5,3)  
= Fib(0,8,5) = 8

# A Challenge: Coin Change Problem

- There are 6 different kinds of Australian coin
- In cents, their values are: 5, 10, 20, 50, 100, 200
- In how many different handfuls of coins can you produce a given amount?  
**Assignment Project Exam Help**  
<https://eduassistpro.github.io/>  
**Add WeChat edu\_assist\_pro**
- This is not an easy problem!
- Key to solving it is to find a way to break it down into simpler sub-problems

# Coin Change Problem: Decomposition

THE UNIVERSITY OF  
MELBOURNE

\$4

made from

Does the bag contain a \$2 coin?

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

Yes

No

+ \$2

made from

\$4

made from

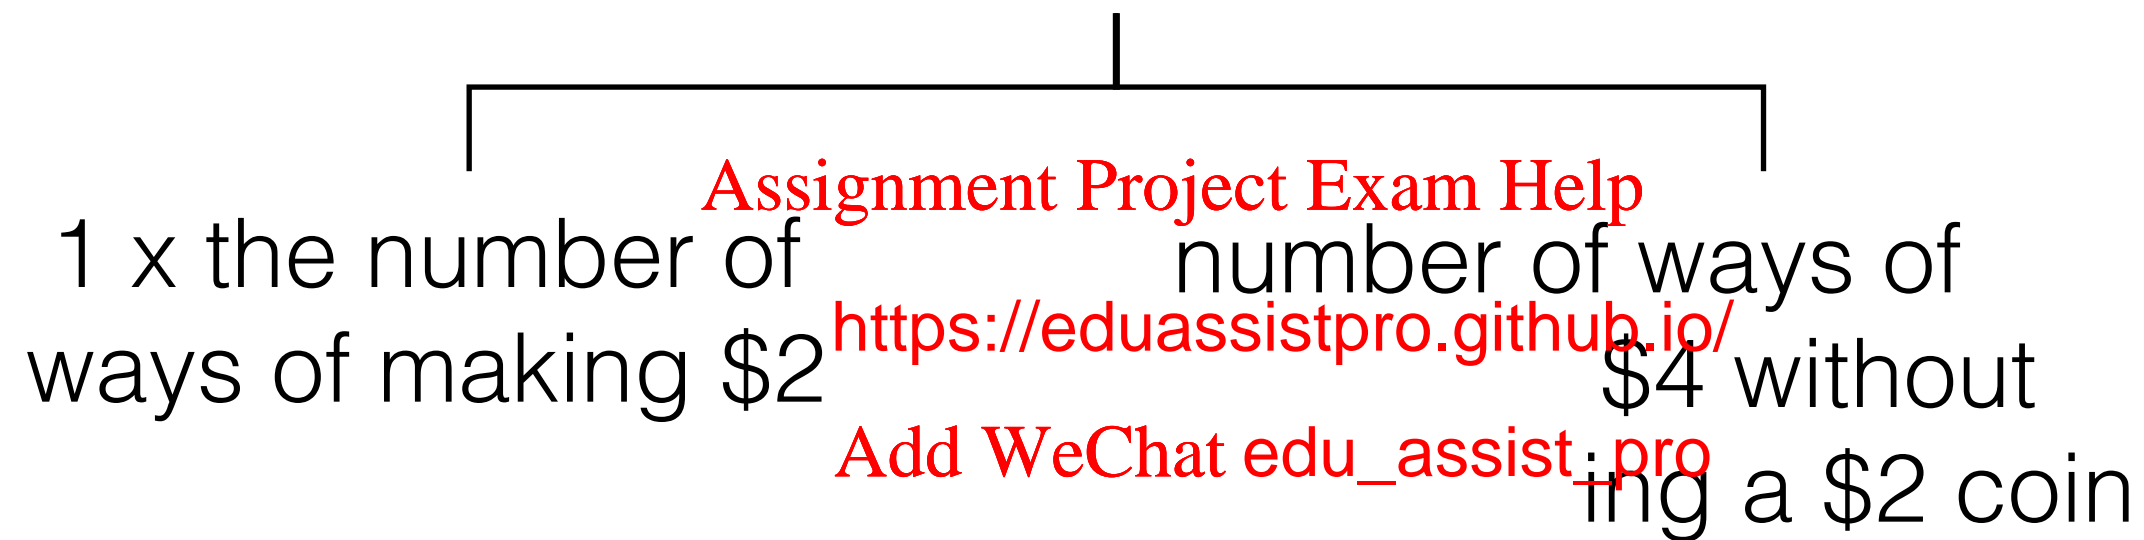

# Coin Change Problem: Decomposition

THE UNIVERSITY OF  
MELBOURNE

The number of ways of making \$4 is therefore:

# Coin Change Problem: Partial Algorithm

```
function WAYS(amount, denominations)
  // ... base cases ....
  d ← selectLargest(denominations)
  return WAYS(amount, denominations) +
    WAYS(amount, denominations \ {d})
```

## For example:

$$\begin{aligned} \text{Ways}(400, \{5, 10, 20, 50, 100, 200\}) = \\ \text{Ways}(200, \{5, 10, 20, 50, 100, 200\}) + \\ \text{Ways}(400, \{5, 10, 20, 50, 100\}) \end{aligned}$$

# Coin Change Problem: Base Cases

- Each time we recurse, we decrease either:
  - amount (by subtracting some quantity from it), or
  - denominations (by removing an item from the set)
- Consider each of <https://eduassistpro.github.io/>
  - amount base cases:
    - amount = 0:
    - amount < 0:
    - denominations =  $\emptyset$  (and amount > 0):

Assignment Project Exam Help

Add WeChat edu\_assist\_pro

# Coin Change Problem: Full Recursive Algorithm

THE UNIVERSITY OF  
MELBOURNE

```
function WAYS(amount, denominations)
  if amount = 0 then
    return 1
  if amount < 0 then
    return 0
  if denomina
    return 0
  d ← selectLargest(denominations)
  return WAYS(amount – d, denominations) +
    WAYS(amount, denominations \ {d})
```

Initial call: WAYS(amount, {5, 10, 20, 50, 100, 200}).

# Recursive Solution and its Complexity

- Although our recursive algorithm is short and elegant, it is not the most efficient way of solving the problem.

Assignment Project Exam Help

- Its running time grows exponentially as you grow the input amount. <https://eduassistpro.github.io/>  
Add WeChat edu\_assist\_pro
- More efficient solutions can be developed using **memoing** or **dynamic programming**—more about that later (around Week 10).
